HUR LABS BT^3 and BT^4

Advanced Balance Testing and Training

Testing excellence
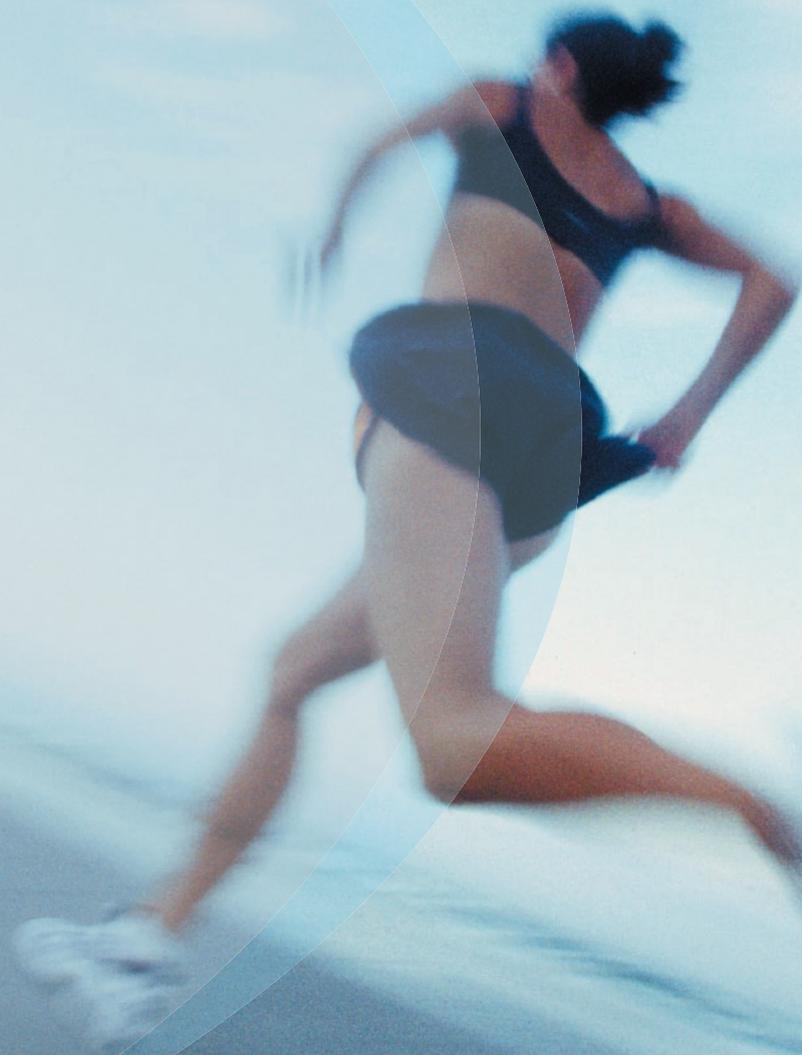

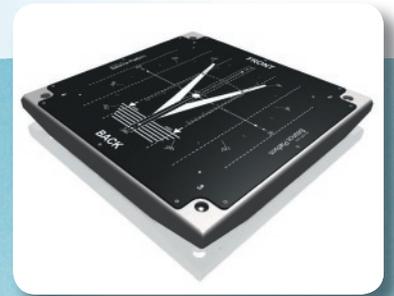

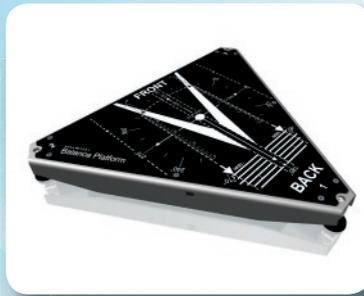

ADVANCED BALANCE TESTING AND TRAINING

The HUR Labs Balance Trainers are portable balance platforms for easy assessment of balance. They are designed to be used at the clinic or in the field. They feature various balance test protocols and balance exercises for motivational training. They are designed for all age groups and are strong enough to be used by even highly obese persons.

Advantages

• Portability
The platforms come with a carrying bag. They are easy to take along and perform the tests and training where-ever the customer is. The bag covers the platform from dust when it is not in use.

• Perfect for field testing - No external power required
The platforms take all power from the USB connection to the laptop. This makes it possible to perform the tests anywhere. Take the balance tests to the customer.

• A wide variety of test protocols - compare results to a large normative database
The HUR Labs Balance Software Suite features commonly used test protocols for easy assessment and follow-up of balance abilities. It is easy to use and the tests are quick to perform. The results can be saved and compared to a large normative database using the correct gender and age groups for each tested person. The user can clearly see if any performances fall outside the normal values and if a need for further testing is required.

• Versatile reporting - clear visual feedback
The results can be interpreted on screen, and the results can be printed out in clear graphs. This can be given to the customer. This will improve the motivation for training. The results can be compared over time to verify the effect of training and the progress of healing.

• Various motivational balance exercises
The HUR Labs Balance Software Suite is a versatile training tool for several aspects of balance. The training is made fun by designing visual feedback enabled games. While playing a game the customer soon forgets he is actually dynamically training his co-ordination and balance abilities. The training starts at a very easy level, and when the customers skills improve the difficulty level can be increased to challenge even well trained persons. An additional level can be added by using foam pads or half balls on top of the platform while training.

• Software updates
HUR Labs keeps the software constantly up to date to reflect the latest changes in balance testing. Registered users can download updates for free for one year from www.hurlabs.com. These updates may include new features and games.

BT3 versus BT4

The BT3 is a highly portable triangular platform ideal for basic field testing. It weighs only 5,6 kg, and due to its smaller shape it is easy to carry where-ever the testing needs to take place.

The BT4 is a portable platform designed for advanced testing. It allows a wide selection of stances due to its optimal size and it makes step training possible as well. The BT4 also features more versatile reporting options. The BT4 is a full featured testing and training platform for more demanding testing.
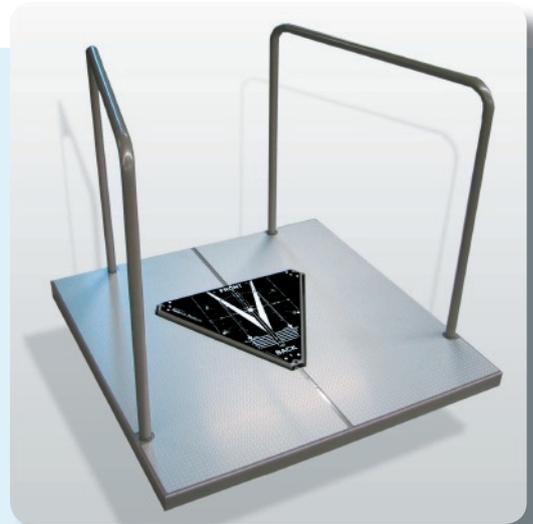

A separate supporting rail system is available as an option to either platform (BT3 support rail in picture).
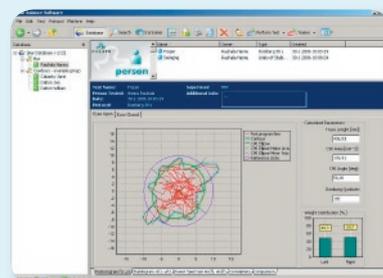

The Balance Trainer Software Suite provides clear and understandable visual feedback of the testing results.

The software features various gamelike balance exercises. The visual feedback training is highly motivational, often you forget you are actually practicing.
